**Maths is absolutely crucial for our survival as independent people and yet many children lose confidence in their ability at a young age. Children's language development and understanding of maths go hand-in-hand, so the best way to nurture their curiosity is to share meaningful conversations with them.**

This award-winning book provides over 40 fun, practical ideas to support children's growing understanding of all aspects of mathematics through real life situations, within play and through adult-led activities in early years settings. It has been written for everyone working with children from twelve months to five years, or older children with additional needs including EAL. Essential reading for anyone looking to inspire a life-long love of maths. 52pp, A4.

*"I found the ideas in this book very clever! Most of the activities can be easily put together using everyday items at a low cost, which is perfect in a pre-school setting. There is great advice on how to lead the children into conversations about maths, and you don't need to be a maths expert to use this. All of the ideas have proven popular."*
